dask-image Documentation

Release 0.1.2+0.gc714522.dirty

John Kirkham

Oct 10, 2018
Contents

1 Features 1
2 Contents 3
3 Indices and tables 39
Python Module Index 41
Features

- Support focuses on Dask Arrays.
- Provides support for loading image files.
- Implements commonly used N-D filters.
- Includes a few N-D Fourier filters.
- Provides some functions for working with N-D label images.
- Supports a few N-D morphological operators.
2.1 Installation

2.1.1 Stable release

To install dask-image, run this command in your terminal:

```bash
$ pip install dask-image
```

This is the preferred method to install dask-image, as it will always install the most recent stable release. If you don’t have pip installed, this Python installation guide can guide you through the process.

2.1.2 From sources

The sources for dask-image can be downloaded from the Github repo.

You can either clone the public repository:

```bash
$ git clone git://github.com/dask/dask-image
```

Or download the tarball:

```bash
$ curl -OL https://github.com/dask/dask-image/tarball/master
```

Once you have a copy of the source, you can install it with:

```bash
$ python setup.py install
```
2.2 API

2.2.1 dask_image package

Subpackages

dask_image.imread package

dask_image.imread.imread(fname, nframes=1)

Read image data into a Dask Array.

Provides a simple, fast mechanism to ingest image data into a Dask Array.

Parameters

- **fname** *(str)* – A glob like string that may match one or multiple filenames.
- **nframes** *(int, optional)* – Number of the frames to include in each chunk (default: 1).

Returns **array** – A Dask Array representing the contents of all image files.

Return type dask.array.Array

dask_image.ndfilters package

dask_image.ndfilters.convolve(input, weights, mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.convolve”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multidimensional convolution.

The array is convolved with the given kernel.

Parameters

- **input** *(array_like)* – The input array.
- **weights** *(array_like)* – Array of weights, same number of dimensions as input
- **mode** *(str or sequence, optional)* – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - **reflect** *(d c b a | a b c d | d c b a)* The input is extended by reflecting about the edge of the last pixel.
  - **constant** *(k k k k | a b c d | k k k k)* The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - **nearest** *(a a a a | a b c d | d d d d)* The input is extended by replicating the last pixel.
  - **mirror** *(d c b | a b c d | c b a)* The input is extended by reflecting about the center of the last pixel.
'wrap' \((a b c d \mid a b c d \mid a b c d)\)  

The input is extended by wrapping around to the opposite edge.

- **cval** *(scalar, optional)* – Value to fill past edges of input if *mode* is ‘constant’. Default is 0.0
- **origin** *(int or sequence, optional)* – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

**Returns** *result* – The result of convolution of *input* with *weights*.

**Return type** *ndarray*

See also:

*correlate()* Correlate an image with a kernel.

**Notes**

Each value in result is \(C_i = \sum_j I_{i+k-j}W_j\), where \(W\) is the *weights* kernel, \(j\) is the n-D spatial index over \(W\), \(I\) is the *input* and \(k\) is the coordinate of the center of \(W\), specified by *origin* in the input parameters.

**Examples**

Perhaps the simplest case to understand is *mode*='constant', *cval*=0.0, because in this case borders (i.e. where the *weights* kernel, centered on any one value, extends beyond an edge of *input*).

```python
>>> a = np.array([[1, 2, 0, 0],
... [5, 3, 0, 4],
... [0, 0, 0, 7],
... [9, 3, 0, 0]])
>>> k = np.array([[1, 1, 1], [1, 1, 0], [1, 0, 0]])
>>> from scipy import ndimage
>>> ndimage.convolve(a, k, mode='constant', cval=0.0)
array([[11, 10, 7, 4],
       [10, 3, 11, 11],
       [15, 12, 14, 7],
       [12, 3, 7, 0]])
```

Setting *cval*=1.0 is equivalent to padding the outer edge of *input* with 1.0’s (and then extracting only the original region of the result).

```python
>>> ndimage.convolve(a, k, mode='constant', cval=1.0)
array([[13, 11, 8, 7],
       [11, 3, 11, 14],
       [16, 12, 14, 10],
       [15, 6, 10, 5]])
```

With **mode**='reflect' (the default), outer values are reflected at the edge of *input* to fill in missing values.

```python
>>> b = np.array([[2, 0, 0],
... [1, 0, 0],
... [0, 0, 0]])
```
```python
>>> k = np.array([[0,1,0], [0,1,0], [0,1,0]])
>>> ndimage.convolve(b, k, mode='reflect')
array([[5, 0, 0],
       [3, 0, 0],
       [1, 0, 0]])
```

This includes diagonally at the corners.

```python
>>> k = np.array([[1,0,0], [0,1,0], [0,0,1]])
>>> ndimage.convolve(b, k)
array([[4, 2, 0],
       [3, 2, 0],
       [1, 1, 0]])
```

With `mode='nearest'`, the single nearest value in to an edge in `input` is repeated as many times as needed to match the overlapping `weights`.

```python
>>> c = np.array([[2, 0, 1], ...
... [1, 0, 0], ...
... [0, 0, 0]])
>>> k = np.array([[0, 1, 0], ...
... [0, 1, 0], ...
... [0, 1, 0], ...
... [0, 1, 0], ...
... [0, 1, 0]])
>>> ndimage.convolve(c, k, mode='nearest')
array([[7, 0, 3],
       [5, 0, 2],
       [3, 0, 1]])
```

dask_image.ndfilters.correlate (input, weights, mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.correlate”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multi-dimensional correlation.

Parameters

- **input** (*array_like*) – The input array.
- **weights** (*ndarray*) – array of weights, same number of dimensions as input
- **mode** (*str or sequence, optional*) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - ‘reflect’ *(d c b a | a b c d | d c b a)* The input is extended by reflecting about the edge of the last pixel.
  - ‘constant’ *(k k k k | a b c d | k k k k)* The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - ‘nearest’ *(a a a a | a b c d | d d d d)* The input is extended by replicating the last pixel.
convolve() Convolve an image with a kernel.

dask_image.ndfilters.gaussian_filter(input, sigma, order=0, mode='reflect', cval=0.0, truncate=4.0)

Wrapped copy of “scipy.ndimage.filters.gaussian_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multidimensional Gaussian filter.

Parameters

- **input** (array_like) – The input array.
- **sigma** (scalar or sequence of scalars) – Standard deviation for Gaussian kernel. The standard deviations of the Gaussian filter are given for each axis as a sequence, or as a single number, in which case it is equal for all axes.
- **order** (int or sequence of ints, optional) – The order of the filter along each axis is given as a sequence of integers, or as a single number. An order of 0 corresponds to convolution with a Gaussian kernel. A positive order corresponds to convolution with that derivative of a Gaussian.
- **mode** (str or sequence, optional) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - 'reflect' (d c b | a b c d | c b a) The input is extended by reflecting about the edge of the last pixel.
  - 'constant' (k k k | a b c d | k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - 'nearest' (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.
  - 'mirror' (d c b | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.
  - 'wrap' (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.
• **cval** (*scalar, optional*) – Value to fill past edges of input if *mode* is ‘constant’. Default is 0.0.

• **truncate** (*float*) – Truncate the filter at this many standard deviations. Default is 4.0.

Returns: **gaussian_filter** – Returned array of same shape as *input*.

Return type: **ndarray**

Notes

The multidimensional filter is implemented as a sequence of one-dimensional convolution filters. The intermediate arrays are stored in the same data type as the output. Therefore, for output types with a limited precision, the results may be imprecise because intermediate results may be stored with insufficient precision.

Examples

```python
gaussian_filter(a, sigma=1)
array([[[4, 6, 8, 9, 11],
   [10, 12, 14, 15, 17],
   [20, 22, 24, 25, 27],
   [29, 31, 33, 34, 36],
   [35, 37, 39, 40, 42]]])
```

```python
from scipy import misc
gaussian_gradient_magnitude = misc.ascent()
result = gaussian_filter(ascent, sigma=5)
```

```
dask_image.ndfilters.gaussian_gradient_magnitude =
```

Wrapped copy of “scipy.ndimage.filters.gaussian_gradient_magnitude”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multidimensional gradient magnitude using Gaussian derivatives.

Parameters

• **input** (*array_like*) – The input array.
• **sigma** (*scalar or sequence of scalars*) – The standard deviations of the Gaussian filter are given for each axis as a sequence, or as a single number, in which case it is equal for all axes.

• **mode** (*str or sequence, optional*) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:

  - **reflect** (d c b a | a b c d | d c b a) The input is extended by reflecting about the edge of the last pixel.
  - **constant** (k k k k | a b c d | k k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - **nearest** (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.
  - **mirror** (d c b a | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.
  - **wrap** (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.

• **cval** (*scalar, optional*) – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.

• **keyword arguments will be passed to gaussian_filter()** *(Extra)* –

  Returns **gaussian_gradient_magnitude** – Filtered array. Has the same shape as input.

  Return type **ndarray**

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt

>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side

>>> ascent = misc.ascent()

>>> result = ndimage.gaussian_gradient_magnitude(ascent, sigma=5)

>>> ax1.imshow(ascent)
>>> ax2.imshow(result)

>>> plt.show()
```

dask_image.ndfilters.gaussian_laplace (*input, sigma, mode=’reflect’, cval=0.0, truncate=4.0, **kwargs*)

Wrapped copy of “scipy.ndimage.filters.gaussian_laplace”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multidimensional Laplace filter using gaussian second derivatives.

**Parameters**

- **input** (*array_like*) – The input array.
• **sigma** *(scalar or sequence of scalars)* – The standard deviations of the Gaussian filter are given for each axis as a sequence, or as a single number, in which case it is equal for all axes.

• **mode** *(str or sequence, optional)* – The *mode* parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:

  - ’reflect’ *(d c b a | a b c d | d c b a)* The input is extended by reflecting about the edge of the last pixel.
  - ’constant’ *(k k k k | a b c d | k k k k)* The input is extended by filling all values beyond the edge with the same constant value, defined by the *cval* parameter.
  - ’nearest’ *(a a a a | a b c d | d d d d)* The input is extended by replicating the last pixel.
  - ’mirror’ *(d c b a | a b c d | c b a)* The input is extended by reflecting about the center of the last pixel.
  - ’wrap’ *(a b c d | a b c d | a b c d)* The input is extended by wrapping around to the opposite edge.

• **cval** *(scalar, optional)* – Value to fill past edges of input if *mode* is ‘constant’. Default is 0.0.

• **keyword arguments will be passed to gaussian_filter()** *(Extra)* –

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> ascent = misc.ascent()

>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side

>>> result = ndimage.gaussian_laplace(ascent, sigma=1)
>>> ax1.imshow(result)

>>> result = ndimage.gaussian_laplace(ascent, sigma=3)
>>> ax2.imshow(result)
```

```python
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side

>>> result = ndimage.gaussian_laplace(ascent, sigma=1)
>>> ax1.imshow(result)

>>> result = ndimage.gaussian_laplace(ascent, sigma=3)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.generic_filter*(input, function, size=None, footprint=None, mode='reflect', cval=0.0, origin=0, extra_arguments=(), extra_keywords={})*

Wrapped copy of “scipy.ndimage.filters.generic_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Calculate a multi-dimensional filter using the given function.
At each element the provided function is called. The input values within the filter footprint at that element are passed to the function as a 1D array of double values.

**Parameters**

- **input (array_like)** – The input array.
- **function ((callable, scipy.LowLevelCallable))** – Function to apply at each element.
- **size (scalar or tuple, optional)** – See footprint, below. Ignored if footprint is given.
- **footprint (array, optional)** – Either size or footprint must be defined. size gives the shape that is taken from the input array, at every element position, to define the input to the filter function. footprint is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus size=(n,m) is equivalent to footprint=np.ones((n,m)). We adjust size to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and size is 2, then the actual size used is (2,2,2). When footprint is given, size is ignored.
- **mode (str or sequence, optional)** – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - ‘reflect’ (d c b a | a b c d | d c b a) The input is extended by reflecting about the edge of the last pixel.
  - ‘constant’ (k k k k | a b c d | k k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - ‘nearest’ (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.
  - ‘mirror’ (d c b | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.
  - ‘wrap’ (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.
- **cval (scalar, optional)** – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.
- **origin (int or sequence, optional)** – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.
- **extra_arguments (sequence, optional)** – Sequence of extra positional arguments to pass to passed function.
- **extra_keywords (dict, optional)** – dict of extra keyword arguments to pass to passed function.

**Notes**

This function also accepts low-level callback functions with one of the following signatures and wrapped in *scipy.LowLevelCallable*:
The calling function iterates over the elements of the input and output arrays, calling the callback function at each element. The elements within the footprint of the filter at the current element are passed through the buffer parameter, and the number of elements within the footprint through filter_size. The calculated value is returned in return_value. user_data is the data pointer provided to scipy.LowLevelCallable as-is.

The callback function must return an integer error status that is zero if something went wrong and one otherwise. If an error occurs, you should normally set the python error status with an informative message before returning, otherwise a default error message is set by the calling function.

In addition, some other low-level function pointer specifications are accepted, but these are for backward compatibility only and should not be used in new code.

dask_image.ndfilters.laplace(input, mode='reflect', cval=0.0)
Wrapped copy of “scipy.ndimage.filters.laplace”
Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

N-dimensional Laplace filter based on approximate second derivatives.

Parameters

• **input**(array_like) – The input array.
• **mode**(str or sequence, optional) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is 'reflect'. The valid values and their behavior is as follows:

  - 'reflect' (d c b a | a b c d | d c b a) The input is extended by reflecting about the edge of the last pixel.
  - 'constant' (k k k k | a b c d | k k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - 'nearest' (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.
  - 'mirror' (d c b | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.
  - 'wrap' (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.
• **cval**(scalar, optional) – Value to fill past edges of input if mode is 'constant'. Default is 0.0.

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
```
dask_image Documentation, Release 0.1.2+0.gc714522.dirty

(continued from previous page)

```python
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.laplace(ascent)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.maximum_filter(input, size=None, footprint=None, mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.maximum_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Calculate a multi-dimensional maximum filter.

Parameters

- **input** (*array_like*) – The input array.
- **size** (*scalar or tuple, optional*) – See footprint, below. Ignored if footprint is given.
- **footprint** (*array, optional*) – Either size or footprint must be defined. size gives the shape that is taken from the input array, at every element position, to define the input to the filter function. footprint is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus size=(n,m) is equivalent to footprint=np.ones((n,m)). We adjust size to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and size is 2, then the actual size used is (2,2,2). When footprint is given, size is ignored.
- **mode** (*str or sequence, optional*) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - 'reflect' (*d c b a | a b c d | d c b a*) The input is extended by reflecting about the edge of the last pixel.
  - 'constant' (*k k k k | a b c d | k k k k*) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - 'nearest' (*a a a a | a b c d | d d d d*) The input is extended by replicating the last pixel.
  - 'mirror' (*d c b | a b c d | c b a*) The input is extended by reflecting about the center of the last pixel.
  - 'wrap' (*a b c d | a b c d | a b c d*) The input is extended by wrapping around to the opposite edge.
- **cval** (*scalar, optional*) – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.
- **origin** (*int or sequence, optional*) – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.
Returns **maximum_filter** – Filtered array. Has the same shape as input.

Return type  ndarray

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.maximum_filter(ascent, size=20)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.median_filter(input, size=None, footprint=None, mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.median_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Calculate a multidimensional median filter.

Parameters

- **input** (*array_like*) – The input array.
- **size** (*scalar or tuple, optional*) – See footprint, below. Ignored if footprint is given.
- **footprint** (*array, optional*) – Either size or footprint must be defined. size gives the shape that is taken from the input array, at every element position, to define the input to the filter function. footprint is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus size=(n,m) is equivalent to footprint=np.ones((n,m)). We adjust size to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and size is 2, then the actual size used is (2,2,2). When footprint is given, size is ignored.
- **mode** (*str or sequence, optional*) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - **'reflect'** (*d c b a | a b c d | d c b a*)  The input is extended by reflecting about the edge of the last pixel.
  - **'constant'** (*k k k k | a b c d | k k k k*)  The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - **'nearest'** (*a a a a | a b c d | d d d d*)  The input is extended by replicating the last pixel.
  - **'mirror'** (*d c b | a b c d | c b a*)  The input is extended by reflecting about the center of the last pixel.

```
The input is extended by wrapping around to the opposite edge.

- **cval** *(scalar, optional)* – Value to fill past edges of input if *mode* is ‘constant’. Default is 0.0.
- **origin** *(int or sequence, optional)* – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

**Returns** `median_filter` – Filtered array. Has the same shape as *input*.

**Return type** `ndarray`

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt

>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.median_filter(ascent, size=20)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.minimum_filter(*input*, *size=None*, *footprint=None*, *mode='reflect'*, *cval=0.0*, *origin=0*)

Wrapped copy of “scipy.ndimage.filters.minimum_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Calculate a multi-dimensional minimum filter.

**Parameters**

- **input** *(array_like)* – The input array.
- **size** *(scalar or tuple, optional)* – See footprint, below. Ignored if footprint is given.
- **footprint** *(array, optional)* – Either *size* or *footprint* must be defined. *size* gives the shape that is taken from the input array, at every element position, to define the input to the filter function. *footprint* is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus *size*=(n,m) is equivalent to *footprint*=np.ones((n,m)). We adjust *size* to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and *size* is 2, then the actual size used is (2,2,2). When *footprint* is given, *size* is ignored.
- **mode** *(str or sequence, optional)* – The *mode* parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:

---

**2.2. API**

15

'reflect' (\(d c b a | a b c d | d c b a\)) The input is extended by reflecting about the edge of the last pixel.

'constant' (\(k k k k | a b c d | k k k k\)) The input is extended by filling all values beyond the edge with the same constant value, defined by the \(cval\) parameter.

'nearest' (\(a a a a | a b c d | a b c d\)) The input is extended by replicating the last pixel.

'mirror' (\(d c b a | a b c d | c b a\)) The input is extended by reflecting about the center of the last pixel.

'wrap' (\(a b c d | a b c d | a b c d\)) The input is extended by wrapping around to the opposite edge.

- \(cval\) (scalar, optional) – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.

- \(origin\) (int or sequence, optional) – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

Returns minimum_filter – Filtered array. Has the same shape as input.

Return type ndarray

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.minimum_filter(ascent, size=20)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.percentile_filter(
    input, percentile, size=None, footprint=None,
    mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.percentile_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Calculate a multi-dimensional percentile filter.

Parameters

- **input** (array_like) – The input array.

- **percentile** (scalar) – The percentile parameter may be less then zero, i.e., percentile = -20 equals percentile = 80

- **size** (scalar or tuple, optional) – See footprint, below. Ignored if footprint is given.
• **footprint** (array, optional) – Either `size` or `footprint` must be defined. `size` gives the shape that is taken from the input array, at every element position, to define the input to the filter function. `footprint` is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus `size=(n,m)` is equivalent to `footprint=np.ones((n,m))`. We adjust `size` to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and `size` is 2, then the actual size used is (2,2,2). When `footprint` is given, `size` is ignored.

• **mode** (str or sequence, optional) – The `mode` parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:

  'reflect' (d c b a | a b c d | d c b a) The input is extended by reflecting about the edge of the last pixel.

  'constant' (k k k k | a b c d | k k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the `cval` parameter.

  'nearest' (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.

  'mirror' (d c b a | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.

  'wrap' (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.

• **cval** (scalar, optional) – Value to fill past edges of input if `mode` is ‘constant’. Default is 0.0.

• **origin** (int or sequence, optional) – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

**Returns** `percentile_filter` – Filtered array. Has the same shape as `input`.

**Return type** ndarray

### Examples

```python
def main():
    from scipy import ndimage, misc
    import matplotlib.pyplot as plt
    fig = plt.figure()
    plt.gray()  # show the filtered result in grayscale
    ax1 = fig.add_subplot(121)  # left side
    ax2 = fig.add_subplot(122)  # right side
    ascent = misc.ascent()
    result = ndimage.percentile_filter(ascent, percentile=20, size=20)
    ax1.imshow(ascent)
    ax1.imshow(result)
    plt.show()
```

dask-image.ndfilters.prewitt(input, axis=-1, mode='reflect', cval=0.0)

Wrapped copy of “scipy.ndimage.filters.prewitt”

Excludes the output parameter as it would not work with Dask arrays.
Original docstring:
Calculate a Prewitt filter.

Parameters

- **input** (*array_like*) – The input array.
- **axis** (*int, optional*) – The axis of input along which to calculate. Default is -1.
- **mode** (*str or sequence, optional*) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - **reflect** (*d c b a | a b c d | d c b a*) – The input is extended by reflecting about the edge of the last pixel.
  - **constant** (*k k k k | a b c d | k k k k*) – The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - **nearest** (*a a a a | a b c d | d d d d*) – The input is extended by replicating the last pixel.
  - **mirror** (*d c b a | a b c d | c b a*) – The input is extended by reflecting about the center of the last pixel.
  - **wrap** (*a b c d | a b c d | a b c d*) – The input is extended by wrapping around to the opposite edge.
- **cval** (*scalar, optional*) – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.prewitt(ascent)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.rank_filter(*input*, rank, size=None, footprint=None, mode=’reflect’, cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.rank_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:
Calculate a multi-dimensional rank filter.

Parameters

- **input** (*array_like*) – The input array.
- **rank** (*int*) – The rank parameter may be less then zero, i.e., rank = -1 indicates the largest element.
- `size` *(scalar or tuple, optional)* – See footprint, below. Ignored if footprint is given.

- `footprint` *(array, optional)* – Either `size` or `footprint` must be defined. `size` gives the shape that is taken from the input array, at every element position, to define the input to the filter function. `footprint` is a boolean array that specifies (implicitly) a shape, but also which of the elements within this shape will get passed to the filter function. Thus `size=(n,m)` is equivalent to `footprint=np.ones((n,m))`. We adjust `size` to the number of dimensions of the input array, so that, if the input array is shape (10,10,10), and `size` is 2, then the actual size used is (2,2,2). When `footprint` is given, `size` is ignored.

- `mode` *(str or sequence, optional)* – The `mode` parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  
  `'reflect' (d c b a | a b c d | d c b a)` The input is extended by reflecting about the edge of the last pixel.

  `'constant' (k k k k | a b c d | k k k k)` The input is extended by filling all values beyond the edge with the same constant value, defined by the `cval` parameter.

  `'nearest' (a a a a | a b c d | d d d d)` The input is extended by replicating the last pixel.

  `'mirror' (d c b | a b c d | c b a)` The input is extended by reflecting about the center of the last pixel.

  `'wrap' (a b c d | a b c d | a b c d)` The input is extended by wrapping around to the opposite edge.

- `cval` *(scalar, optional)* – Value to fill past edges of input if `mode` is ‘constant’. Default is 0.0.

- `origin` *(int or sequence, optional)* – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

Returns `rank_filter` – Filtered array. Has the same shape as `input`.

Return type `ndarray`

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.rank_filter(ascent, rank=42, size=20)
>>> ax1.imshow(ascent)
>>> ax1.imshow(result)
>>> plt.show()
```
dask_image.ndfilters.sobel(input, axis=-1, mode='reflect', cval=0.0)

Wrapped copy of “scipy.ndimage.filters.sobel”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:
Calculate a Sobel filter.

Parameters

- **input** (array_like) – The input array.
- **axis** (int, optional) – The axis of input along which to calculate. Default is -1.
- **mode** (str or sequence, optional) – The mode parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:
  - ‘reflect’ (d c b a | a b c d | d c b a) The input is extended by reflecting about the edge of the last pixel.
  - ‘constant’ (k k k k | a b c d | k k k k) The input is extended by filling all values beyond the edge with the same constant value, defined by the cval parameter.
  - ‘nearest’ (a a a a | a b c d | d d d d) The input is extended by replicating the last pixel.
  - ‘mirror’ (d c b a | a b c d | c b a) The input is extended by reflecting about the center of the last pixel.
  - ‘wrap’ (a b c d | a b c d | a b c d) The input is extended by wrapping around to the opposite edge.
- **cval** (scalar, optional) – Value to fill past edges of input if mode is ‘constant’. Default is 0.0.

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.sobel(ascent)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```

dask_image.ndfilters.uniform_filter(input, size=3, mode='reflect', cval=0.0, origin=0)

Wrapped copy of “scipy.ndimage.filters.uniform_filter”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:
Multi-dimensional uniform filter.

Parameters
• **input** (*array_like*) – The input array.

• **size** (*int or sequence of ints, optional*) – The sizes of the uniform filter are given for each axis as a sequence, or as a single number, in which case the size is equal for all axes.

• **mode** (*str or sequence, optional*) – The *mode* parameter determines how the input array is extended when the filter overlaps a border. By passing a sequence of modes with length equal to the number of dimensions of the input array, different modes can be specified along each axis. Default value is ‘reflect’. The valid values and their behavior is as follows:

  - `'reflect'` (*d c b a | a b c d | d c b a*) The input is extended by reflecting about the edge of the last pixel.
  - `'constant'` (*k k k k | a b c d | k k k k*) The input is extended by filling all values beyond the edge with the same constant value, defined by the *cval* parameter.
  - `'nearest'` (*a a a a | a b c d | d d d d*) The input is extended by replicating the last pixel.
  - `'mirror'` (*d c b | a b c d | c b a*) The input is extended by reflecting about the center of the last pixel.
  - `'wrap'` (*a b c d | a b c d | a b c d*) The input is extended by wrapping around to the opposite edge.

• **cval** (*scalar, optional*) – Value to fill past edges of input if *mode* is ‘constant’. Default is 0.0.

• **origin** (*int or sequence, optional*) – Controls the placement of the filter on the input array’s pixels. A value of 0 (the default) centers the filter over the pixel, with positive values shifting the filter to the left, and negative ones to the right. By passing a sequence of origins with length equal to the number of dimensions of the input array, different shifts can be specified along each axis.

**Returns** uniform_filter – Filtered array. Has the same shape as *input*.

**Return type** ndarray

**Notes**

The multi-dimensional filter is implemented as a sequence of one-dimensional uniform filters. The intermediate arrays are stored in the same data type as the output. Therefore, for output types with a limited precision, the results may be imprecise because intermediate results may be stored with insufficient precision.

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> fig = plt.figure()
>>> plt.gray()  # show the filtered result in grayscale
>>> ax1 = fig.add_subplot(121)  # left side
>>> ax2 = fig.add_subplot(122)  # right side
>>> ascent = misc.ascent()
>>> result = ndimage.uniform_filter(ascent, size=20)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result)
>>> plt.show()
```
dask_image.ndfourier package

`dask_image.ndfourier.fourier_gaussian(input, sigma, n=-1, axis=-1)`

Multi-dimensional Gaussian fourier filter.

The array is multiplied with the fourier transform of a Gaussian kernel.

**Parameters**

- `input (array_like)` – The input array.
- `sigma (float or sequence)` – The sigma of the Gaussian kernel. If a float, `sigma` is the same for all axes. If a sequence, `sigma` has to contain one value for each axis.
- `n (int, optional)` – If `n` is negative (default), then the input is assumed to be the result of a complex fft. If `n` is larger than or equal to zero, the input is assumed to be the result of a real fft, and `n` gives the length of the array before transformation along the real transform direction.
- `axis (int, optional)` – The axis of the real transform.

**Returns**

`fourier_gaussian`

**Return type** Dask Array

**Examples**

```python
>>> from scipy import ndimage, misc
>>> import numpy.fft
>>> import matplotlib.pyplot as plt

>>> fig, (ax1, ax2) = plt.subplots(1, 2)
>>> plt.gray()  # show the filtered result in grayscale
>>> ascent = misc.ascent()
>>> input_ = numpy.fft.fft2(ascent)
>>> result = ndimage.fourier_gaussian(input_, sigma=4)
>>> result = numpy.fft.ifft2(result)
>>> ax1.imshow(ascent)
```

`dask_image.ndfourier.fourier_shift(input, shift, n=-1, axis=-1)`

Multi-dimensional fourier shift filter.

The array is multiplied with the fourier transform of a shift operation.

**Parameters**

- `input (array_like)` – The input array.
- `shift (float or sequence)` – The size of the box used for filtering. If a float, `shift` is the same for all axes. If a sequence, `shift` has to contain one value for each axis.
- `n (int, optional)` – If `n` is negative (default), then the input is assumed to be the result of a complex fft. If `n` is larger than or equal to zero, the input is assumed to be the result of a real fft, and `n` gives the length of the array before transformation along the real transform direction.
- `axis (int, optional)` – The axis of the real transform.

**Returns**

`fourier_shift`

**Return type** Dask Array
Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> import numpy.fft
>>> fig, (ax1, ax2) = plt.subplots(1, 2)
>>> plt.gray()  # show the filtered result in grayscale
>>> ascent = misc.ascent()
>>> input_ = numpy.fft.fft2(ascent)
>>> result = ndimage.fourier_shift(input_, shift=200)
>>> result = numpy.fft.ifft2(result)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result.real)  # the imaginary part is an artifact
>>> plt.show()
```

dask_image.ndfourier.fourier_uniform(input, size=-1, axis=-1)

The array is multiplied with the fourier transform of a box of given size.

**Parameters**

- **input (array_like)** – The input array.
- **size (float or sequence)** – The size of the box used for filtering. If a float, size is the same for all axes. If a sequence, size has to contain one value for each axis.
- **n (int, optional)** – If n is negative (default), then the input is assumed to be the result of a complex fft. If n is larger than or equal to zero, the input is assumed to be the result of a real fft, and n gives the length of the array before transformation along the real transform direction.
- **axis (int, optional)** – The axis of the real transform.

**Returns** fooer_uniform – The filtered input. If output is given as a parameter, None is returned.

**Return type** Dask Array

Examples

```python
>>> from scipy import ndimage, misc
>>> import matplotlib.pyplot as plt
>>> import numpy.fft
>>> fig, (ax1, ax2) = plt.subplots(1, 2)
>>> plt.gray()  # show the filtered result in grayscale
>>> ascent = misc.ascent()
>>> input_ = numpy.fft.fft2(ascent)
>>> result = ndimage.fourier_uniform(input_, size=20)
>>> result = numpy.fft.ifft2(result)
>>> ax1.imshow(ascent)
>>> ax2.imshow(result.real)  # the imaginary part is an artifact
>>> plt.show()
```

dask_image.ndmeasure package

dask_image.ndmeasure.center_of_mass(input, labels=None, index=None)

Find the center of mass over an image at specified subregions.
Parameters

• **input** (*ndarray*) – N-D image data

• **labels** (*ndarray, optional*) – Image features noted by integers. If None (default), all values.

• **index** (*int or sequence of ints, optional*) – Labels to include in output. If None (default), all values where non-zero labels are used.

The `index` argument only works when `labels` is specified.

**Returns** `center_of_mass` – Coordinates of centers-of-mass of `input` over the `index` selected regions from `labels`.

**Return type** `ndarray`

dask_image.ndmeasure.extrema(*input, labels=None, index=None*)

Find the min and max with positions over an image at specified subregions.

Parameters

• **input** (*ndarray*) – N-D image data

• **labels** (*ndarray, optional*) – Image features noted by integers. If None (default), all values.

• **index** (*int or sequence of ints, optional*) – Labels to include in output. If None (default), all values where non-zero labels are used.

The `index` argument only works when `labels` is specified.

**Returns** `minimums, maximums, min_positions, max_positions` – Values and coordinates of minimums and maximums in each feature.

**Return type** `tuple of ndarrays`

dask_image.ndmeasure.histogram(*input, min, max, bins=None, labels=None, index=None*)

Find the histogram over an image at specified subregions.

Histogram calculates the frequency of values in an array within bins determined by `min`, `max`, and `bins`. The `labels` and `index` keywords can limit the scope of the histogram to specified sub-regions within the array.

Parameters

• **input** (*ndarray*) – N-D image data

• **min** (*int*) – Minimum value of range of histogram bins.

• **max** (*int*) – Maximum value of range of histogram bins.

• **bins** (*int*) – Number of bins.

• **labels** (*ndarray, optional*) – Image features noted by integers. If None (default), all values.

• **index** (*int or sequence of ints, optional*) – Labels to include in output. If None (default), all values where non-zero labels are used.

The `index` argument only works when `labels` is specified.

**Returns** `histogram` – Histogram of `input` over the `index` selected regions from `labels`.

**Return type** `ndarray`

dask_image.ndmeasure.label(*input, structure=None*)

Label features in an array.
Parameters

- **input (ndarray)** – An array-like object to be labeled. Any non-zero values in `input` are counted as features and zero values are considered the background.

- **structure (ndarray, optional)** – A structuring element that defines feature connections. `structure` must be symmetric. If no structuring element is provided, one is automatically generated with a squared connectivity equal to one. That is, for a 2-D `input` array, the default structuring element is:

  ```
  [[0,1,0],
   [1,1,1],
   [0,1,0]]
  ```

Returns

- **label (ndarray or int)** – An integer ndarray where each unique feature in `input` has a unique label in the returned array.

- **num_features (int)** – How many objects were found.

```python
dask_image.ndmeasure.labeled_comprehension(input, labels, index, func, out_dtype, default, pass_positions=False)
```

Compute a function over an image at specified subregions.

Roughly equivalent to `[func(input[labels == i]) for i in index]`.

Sequentially applies an arbitrary function (that works on array_like input) to subsets of an n-D image array specified by `labels` and `index`. The option exists to provide the function with positional parameters as the second argument.

Parameters

- **input (ndarray)** – N-D image data

- **labels (ndarray, optional)** – Image features noted by integers. If None (default), all values.

- **index (int or sequence of ints, optional)** – Labels to include in output. If None (default), all values where non-zero `labels` are used.

  The `index` argument only works when `labels` is specified.

- **func (callable)** – Python function to apply to `labels` from `input`.

- **out_dtype (dtype)** – Dtype to use for `result`.

- **default (int, float or None)** – Default return value when a element of `index` does not exist in `labels`.

- **pass_positions (bool, optional)** – If True, pass linear indices to `func` as a second argument. Default is False.

Returns `result` – Result of applying `func` on `input` over the `index` selected regions from `labels`.

Return type `ndarray`

```python
dask_image.ndmeasure.maximum(input, labels=None, index=None)
```

Find the maxima over an image at specified subregions.

Parameters

- **input (ndarray)** – N-D image data
parameters:

- **labels** *(ndarray, optional)* – Image features noted by integers. If None (default), all values.
- **index** *(int or sequence of ints, optional)* – Labels to include in output. If None (default), all values where non-zero labels are used. The index argument only works when labels is specified.

**Returns** maxima – Maxima of input over the index selected regions from labels.

**Return type** ndarray

dask_image.ndmeasure.maximum_position *(input, labels=None, index=None)*

Find the positions of maxima over an image at specified subregions.

For each region specified by labels, the position of the maximum value of input within the region is returned.

**Parameters**

- **input** *(ndarray)* – N-D image data
- **labels** *(ndarray, optional)* – Image features noted by integers. If None (default), all values.
- **index** *(int or sequence of ints, optional)* – Labels to include in output. If None (default), all values where non-zero labels are used. The index argument only works when labels is specified.

**Returns** maxima_positions – Maxima positions of input over the index selected regions from labels.

**Return type** ndarray

dask_image.ndmeasure.mean *(input, labels=None, index=None)*

Find the mean over an image at specified subregions.

**Parameters**

- **input** *(ndarray)* – N-D image data
- **labels** *(ndarray, optional)* – Image features noted by integers. If None (default), all values.
- **index** *(int or sequence of ints, optional)* – Labels to include in output. If None (default), all values where non-zero labels are used. The index argument only works when labels is specified.

**Returns** means – Mean of input over the index selected regions from labels.

**Return type** ndarray

dask_image.ndmeasure.median *(input, labels=None, index=None)*

Find the median over an image at specified subregions.

**Parameters**

- **input** *(ndarray)* – N-D image data
- **labels** *(ndarray, optional)* – Image features noted by integers. If None (default), all values.
- **index** *(int or sequence of ints, optional)* – Labels to include in output. If None (default), all values where non-zero labels are used.
The index argument only works when labels is specified.

Returns medians – Median of input over the index selected regions from labels.

Return type ndarray

dask_image.ndmeasure.minimum(input, labels=None, index=None)
Find the minima over an image at specified subregions.

Parameters

- input (ndarray) – N-D image data
- labels (ndarray, optional) – Image features noted by integers. If None (default), all values.
- index (int or sequence of ints, optional) – Labels to include in output. If None (default), all values where non-zero labels are used.

The index argument only works when labels is specified.

Returns minima – Minima of input over the index selected regions from labels.

Return type ndarray

dask_image.ndmeasure.minimum_position(input, labels=None, index=None)
Find the positions of minima over an image at specified subregions.

Parameters

- input (ndarray) – N-D image data
- labels (ndarray, optional) – Image features noted by integers. If None (default), all values.
- index (int or sequence of ints, optional) – Labels to include in output. If None (default), all values where non-zero labels are used.

The index argument only works when labels is specified.

Returns minima_positions – Maxima positions of input over the index selected regions from labels.

Return type ndarray

dask_image.ndmeasure.standard_deviation(input, labels=None, index=None)
Find the standard deviation over an image at specified subregions.

Parameters

- input (ndarray) – N-D image data
- labels (ndarray, optional) – Image features noted by integers. If None (default), all values.
- index (int or sequence of ints, optional) – Labels to include in output. If None (default), all values where non-zero labels are used.

The index argument only works when labels is specified.

Returns standard_deviation – Standard deviation of input over the index selected regions from labels.

Return type ndarray

dask_image.ndmeasure.sum(input, labels=None, index=None)
Find the sum over an image at specified subregions.
Parameters

- **input (ndarray)** – N-D image data
- **labels (ndarray, optional)** – Image features noted by integers. If None (default), all values.
- **index (int or sequence of ints, optional)** – Labels to include in output. If None (default), all values where non-zero labels are used.

The index argument only works when labels is specified.

Returns **sum** – Sum of input over the index selected regions from labels.

Return type **ndarray**

dask_image.ndmeasure.variance(input, labels=None, index=None)

Find the variance over an image at specified subregions.

Parameters

- **input (ndarray)** – N-D image data
- **labels (ndarray, optional)** – Image features noted by integers. If None (default), all values.
- **index (int or sequence of ints, optional)** – Labels to include in output. If None (default), all values where non-zero labels are used.

The index argument only works when labels is specified.

Returns **variance** – Variance of input over the index selected regions from labels.

Return type **ndarray**

dask_image.ndmorph package

dask_image.ndmorph.binary_closing(input, structure=None, iterations=1, origin=0)

Wrapped copy of “scipy.ndimage.morphology.binary_closing”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multi-dimensional binary closing with the given structuring element.

The closing of an input image by a structuring element is the erosion of the dilation of the image by the structuring element.

Parameters

- **input (array_like)** – Binary array_like to be closed. Non-zero (True) elements form the subset to be closed.
- **structure (array_like, optional)** – Structuring element used for the closing. Non-zero elements are considered True. If no structuring element is provided an element is generated with a square connectivity equal to one (i.e., only nearest neighbors are connected to the center, diagonally-connected elements are not considered neighbors).
- **iterations ((int, float), optional)** – The dilation step of the closing, then the erosion step are each repeated iterations times (one, by default). If iterations is less than 1, each operations is repeated until the result does not change anymore.
• **origin** *(int or tuple of ints, optional)* – Placement of the filter, by default 0.

• **mask** *(array_like, optional)* – If a mask is given, only those elements with a True value at the corresponding mask element are modified at each iteration.

  New in version 1.1.0.

• **border_value** *(int (cast to 0 or 1), optional)* – Value at the border in the output array.

  New in version 1.1.0.

• **brute_force** *(boolean, optional)* – Memory condition: if False, only the pixels whose value was changed in the last iteration are tracked as candidates to be updated in the current iteration; if true all pixels are considered as candidates for update, regardless of what happened in the previous iteration. False by default.

  New in version 1.1.0.

**Returns**  
**binary_closing** – Closing of the input by the structuring element.

**Return type**  
ndarray of bools

**See also:**  
grey_closing(),  
binary_opening(),  
binary_dilation(),  
binary_erosion(),  
generate_binary_structure()

**Notes**

Closing [1] is a mathematical morphology operation [2] that consists in the succession of a dilation and an erosion of the input with the same structuring element. Closing therefore fills holes smaller than the structuring element.

Together with opening (binary_opening), closing can be used for noise removal.

**References**

**Examples**

```python
>>> from scipy import ndimage
>>> a = np.zeros((5,5), dtype=int)
>>> a[1:-1, 1:-1] = 1; a[2,2] = 0
>>> a
array([[0, 0, 0, 0, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 0, 0, 0, 0]])
>>> # Closing removes small holes
>>> ndimage.binary_closing(a).astype(int)
array([[0, 0, 0, 0, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 0, 0, 0, 0]])
>>> # Closing is the erosion of the dilation of the input
```

(continues on next page)
>>> ndimage.binary_dilation(a).astype(int)
array([[0, 1, 1, 1, 0],
       [1, 1, 1, 1, 1],
       [1, 1, 1, 1, 1],
       [1, 1, 1, 1, 1],
       [0, 1, 1, 1, 0]]))

>>> ndimage.binary_erosion(ndimage.binary_dilation(a)).astype(int)
array([[0, 0, 0, 0, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 1, 1, 1, 0],
       [0, 0, 0, 0, 0]])

```python
>>> a = np.zeros((7,7), dtype=int)
>>> a[1:6, 2:5] = 1; a[1:3,3] = 0
>>> a
array([[0, 0, 0, 0, 0, 0, 0],
       [0, 0, 1, 0, 1, 0, 0],
       [0, 0, 1, 0, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 0, 0, 0, 0]])
```

```text
# In addition to removing holes, closing can also
# coarsen boundaries with fine hollows.
```

```python
>>> ndimage.binary_closing(a).astype(int)
array([[0, 0, 0, 0, 0, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 0, 0, 0, 0]])
```

```python
>>> ndimage.binary_closing(a, structure=np.ones((2,2))).astype(int)
array([[0, 0, 0, 0, 0, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 1, 1, 1, 0, 0],
       [0, 0, 0, 0, 0, 0]])
```

dask_image.ndmorph.binary_dilation(input, structure=None, iterations=1, mask=None, border_value=0, origin=0, brute_force=False)

Wrapped copy of “scipy.ndimage.morphology.binary_dilation”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multi-dimensional binary dilation with the given structuring element.

Parameters

- **input (array_like)** – Binary array_like to be dilated. Non-zero (True) elements form the subset to be dilated.
- **structure (array_like, optional)** – Structuring element used for the dilation. Non-zero elements are considered True. If no structuring element is provided an element is
generates a square connectivity equal to one.

- **iterations** *(int, float, optional)* – The dilation is repeated *iterations* times (one, by default). If iterations is less than 1, the dilation is repeated until the result does not change anymore.

- **mask** *(array_like, optional)* – If a mask is given, only those elements with a True value at the corresponding mask element are modified at each iteration.

- **origin** *(int or tuple of ints, optional)* – Placement of the filter, by default 0.

- **brute_force** *(boolean, optional)* – Memory condition: if False, only the pixels whose value was changed in the last iteration are tracked as candidates to be updated (dilated) in the current iteration; if True all pixels are considered as candidates for dilation, regardless of what happened in the previous iteration. False by default.

**Returns** binary_dilation – Dilation of the input by the structuring element.

**Return type** ndarray of bools

**See also:**
grey_dilation(), binary_erosion(), binary_closing(), binary_opening(), generate_binary_structure()

**Notes**

Dilation [1] is a mathematical morphology operation [2] that uses a structuring element for expanding the shapes in an image. The binary dilation of an image by a structuring element is the locus of the points covered by the structuring element, when its center lies within the non-zero points of the image.

       [ 0.,  0.,  0.,  0.,  0.]])
```
# 3x3 structuring element with connectivity 1, used by default

```python
>>> struct1 = ndimage.generate_binary_structure(2, 1)
>>> struct1
array([[False,  True, False],
       [ True,  True,  True],
       [False,  True, False]], dtype=bool)
```

# 3x3 structuring element with connectivity 2

```python
>>> struct2 = ndimage.generate_binary_structure(2, 2)
>>> struct2
array([[ True,  True,  True],
       [ True,  True,  True],
       [ True,  True,  True]], dtype=bool)
```

```python
>>> ndimage.binary_dilation(a, structure=struct1).astype(a.dtype)
array([[ 0., 0., 0., 0., 0.],
       [ 0., 0., 1., 0., 0.],
       [ 0., 1., 1., 1., 0.],
       [ 0., 0., 1., 0., 0.],
       [ 0., 0., 0., 0., 0.]])

>>> ndimage.binary_dilation(a, structure=struct2).astype(a.dtype)
array([[ 0., 0., 0., 0., 0.],
       [ 0., 1., 1., 1., 0.],
       [ 0., 1., 1., 1., 0.],
       [ 0., 1., 1., 1., 0.],
       [ 0., 0., 0., 0., 0.]]

>>> ndimage.binary_dilation(a, structure=struct1, iterations=2).astype(a.dtype)
array([[ 0., 0., 1., 0., 0.],
       [ 0., 1., 1., 1., 0.],
       [ 1., 1., 1., 1., 1.],
       [ 0., 1., 1., 1., 0.],
       [ 0., 0., 1., 0., 0.]])
```

dask_image.ndmorph.binary_erosion(input, structure=None, iterations=1, mask=None, border_value=0, origin=0, brute_force=False)

Wrapped copy of “scipy.ndimage.morphology.binary_erosion”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multi-dimensional binary erosion with a given structuring element.

Binary erosion is a mathematical morphology operation used for image processing.

**Parameters**

- **input** (*array_like*) – Binary image to be eroded. Non-zero (True) elements form the subset to be eroded.

- **structure** (*array_like, optional*) – Structuring element used for the erosion. Non-zero elements are considered True. If no structuring element is provided, an element is generated with a square connectivity equal to one.

- **iterations** (*int, float, optional*) – The erosion is repeated `iterations` times (one, by default). If iterations is less than 1, the erosion is repeated until the result does not change anymore.

- **mask** (*array_like, optional*) – If a mask is given, only those elements with a True value at the corresponding mask element are modified at each iteration.
• **origin** (:obj:`int` or :obj:`tuple of ints`, :obj:`optional`) – Placement of the filter, by default 0.

• **brute_force** (:obj:`boolean`, :obj:`optional`) – Memory condition: if False, only the pixels whose value was changed in the last iteration are tracked as candidates to be updated (eroded) in the current iteration; if True all pixels are considered as candidates for erosion, regardless of what happened in the previous iteration. False by default.

**Returns** **binary_erosion** – Erosion of the input by the structuring element.

**Return type** `ndarray of bools`

See also:

grey_erosion(), binary_dilation(), binary_closing(), binary_opening(), generate_binary_structure()

Notes

Erosion [1] is a mathematical morphology operation [2] that uses a structuring element for shrinking the shapes in an image. The binary erosion of an image by a structuring element is the locus of the points where a superimposition of the structuring element centered on the point is entirely contained in the set of non-zero elements of the image.

[0, 0, 0, 0, 0, 0, 0]])
```

2.2. API
binary_opening(input, structure=None, iterations=1, origin=0)

Wrapped copy of “scipy.ndimage.morphology.binary_opening”

Excludes the output parameter as it would not work with Dask arrays.

Original docstring:

Multi-dimensional binary opening with the given structuring element.

The opening of an input image by a structuring element is the dilation of the erosion of the image by the structuring element.

Parameters

- **input** (array_like) – Binary array_like to be opened. Non-zero (True) elements form the subset to be opened.
- **structure** (array_like, optional) – Structuring element used for the opening. Non-zero elements are considered True. If no structuring element is provided an element is generated with a square connectivity equal to one (i.e., only nearest neighbors are connected to the center, diagonally-connected elements are not considered neighbors).
- **iterations** ((int, float), optional) – The erosion step of the opening, then the dilation step are each repeated iterations times (one, by default). If iterations is less than 1, each operation is repeated until the result does not change anymore.
- **origin** (int or tuple of ints, optional) – Placement of the filter, by default 0.
- **mask** (array_like, optional) – If a mask is given, only those elements with a True value at the corresponding mask element are modified at each iteration.

New in version 1.1.0.
- **border_value** (int (cast to 0 or 1), optional) – Value at the border in the output array.

New in version 1.1.0.
- **brute_force** (boolean, optional) – Memory condition: if False, only the pixels whose value was changed in the last iteration are tracked as candidates to be updated in the current iteration; if true all pixels are considered as candidates for update, regardless of what happened in the previous iteration. False by default.

New in version 1.1.0.

Returns binary_opening – Opening of the input by the structuring element.

Return type ndarray of bools

See also:

grey_opening(), binary_closing(), binary_erosion(), binary_dilation(), generate_binary_structure()

Notes

Opening [1] is a mathematical morphology operation [2] that consists in the succession of an erosion and a dilation of the input with the same structuring element. Opening therefore removes objects smaller than the structuring element.

Together with closing (binary_closing), opening can be used for noise removal.

        [0, 0, 0, 0, 0]])
```

2.3 Contributing

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given. You can contribute in many ways:

2.3.1 Types of Contributions

Report Bugs

If you are reporting a bug, please include:
• Your operating system name and version.
• Any details about your local setup that might be helpful in troubleshooting.
• Detailed steps to reproduce the bug.

Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” and “help wanted” is open to whoever wants to implement it.

Implement Features

Look through the GitHub issues for features. Anything tagged with “enhancement” and “help wanted” is open to whoever wants to implement it.

Write Documentation

dask-image could always use more documentation, whether as part of the official dask-image docs, in docstrings, or even on the web in blog posts, articles, and such.

Submit Feedback

The best way to send feedback is to file an issue at https://github.com/dask/dask-image/issues.

If you are proposing a feature:

• Explain in detail how it would work.
• Keep the scope as narrow as possible, to make it easier to implement.
• Remember that this is a volunteer-driven project, and that contributions are welcome :)

2.3.2 Get Started!

Ready to contribute? Here’s how to set up dask-image for local development.

1. Fork the dask-image repo on GitHub.
2. Clone your fork locally:

   ```
   $ git clone git@github.com:your_name_here/dask-image.git
   ```

3. Install your local copy into an environment. Assuming you have conda installed, this is how you set up your fork for local development (on Windows drop `source`). Replace “<some version>” with the Python version used for testing.:

   ```
   $ conda create -n dask-image-env python="<some version>"
   $ source activate dask-image-env
   $ python setup.py develop
   ```

4. Create a branch for local development:

   ```
   $ git checkout -b name-of-your-bugfix-or-feature
   ```
Now you can make your changes locally.

5. When you’re done making changes, check that your changes pass flake8 and the tests, including testing other Python versions:

   $ flake8 dask_image tests
   $ python setup.py test or py.test

   To get flake8, just conda install it into your environment.

6. Commit your changes and push your branch to GitHub:

   $ git add .
   $ git commit -m "Your detailed description of your changes."
   $ git push origin name-of-your-bugfix-or-feature

7. Submit a pull request through the GitHub website.

2.3.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests.

2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring, and add the feature to the list in README.rst.

3. The pull request should work for all supported Python versions. Check CIs and make sure that the tests pass for all supported Python versions and platforms.

2.3.4 Tips

To run a subset of tests:

   $ py.test tests/test_dask_image.py

2.4 Credits

2.4.1 Development Lead

   • John Kirkham <kirkhamj@janelia.hhmi.org>

2.4.2 Contributors

None yet. Why not be the first?

2.5 History

2.5.1 0.1.1 (2018-08-31)

   • Fix a bug in an ndmeasure test of an internal function.
2.5.2 0.1.0 (2018-08-31)

- First release on PyPI.
- Pulls in content from dask-image org.
- Supports reading of image files into Dask.
- Provides basic N-D filters with options to extend.
- Provides a few N-D Fourier filters.
- Provides a few N-D morphological filters.
- Provides a few N-D measurement functions for label images.
- Has 100% line coverage in test suite.
